Antibioticabeleid

Inhoud presentatie

- Doseringstabel
- Antibacteriële middelen
 - “BP in Brackets”
 - Aparte screeningsbreekpunten
 - DD voor anaeroben
 - Nieuwe breekpunten
- Antifungale middelen

Erasmus MC Universiteit Medisch Centrum Rotterdam  **SWAB** Stichting Werkgroep Antibioticabeleid  H+ MC 

Doseringen

- Opmerking geplaatst “The high exposure dosing regimen pertains to the severity of the infection or drug exposure at the site of infection”
 - Oxacilline
 - Cloxacilline
 - Dicloxacilline
 - Flucloxacilline
 - Clindamycine
- Rifampicine: hoge dosering is verwijderd (alleen 600mg 1dd)

Erasmus MC Universiteit Medisch Centrum Rotterdam  **SWAB** Stichting Werkgroep Antibioticabeleid  H+ MC 

“breakpoints in brackets”

- Onderscheid tussen isolaten met en zonder fenotypisch detecteerbaar resistentie mechanisme.
- Gebaseerd op ECOFF
- Indien meerdere species in 1 groep, dan ‘best fit’ ECOFF.
- Geen klinisch bewijs dat monotherapie effectief is
- Meestal gegeven in combinatie met ander antibioticum

Erasmus MC Universitair Medisch Centrum Rotterdam  **SWAB** Stichting Werkgroep Antibioticabeleid 

“breakpoints in brackets”

Groep	Antibioticum
Enterobacterales	Colistine
Pseudomonas	Colistine
Acinetobacter	Colistine
Stafylokokken	Aminoglycosiden
Bacteroides	clindamycine
<i>Reeds in tabel 2021</i>	
Enterobacterales	Amikacine, tobramycine en gentamicine
Pseudomonas	Amikacine en tobramycine

Erasmus MC Universitair Medisch Centrum Rotterdam  **SWAB** Stichting Werkgroep Antibioticabeleid 

Aparte screeningsbreekpunten

- Screeningstest gebruikt 1 antibioticum om resistentie tegen een of middelen van dezelfde klasse te voorspellen.
- Vaak gevoeliger en/of robuster dan het testen van een individueel middel
- Minder testen nodig

Erasmus MC  **SWAB** Stichting Werkgroep Antibioticabeleid 

Algemene interpretatie

- Negative screening test:
 - MIC below or equal to or zone diameter above or equal to the susceptible breakpoint for the screening agent. No resistance mechanisms to the antimicrobial class detected.
- Positive screening test:
 - MIC above or zone diameter below the resistant breakpoint for the screening agent. Resistance mechanisms to the antimicrobial class detected.

Instructies om te handelen bij individuele testen staat bij de 'Note' van de betreffende test.

Erasmus MC  **SWAB** Stichting Werkgroep Antibioticabeleid 

Aparte screeningsbreekpunten

groep	Screening
Stafylokokken	Erytromycine
Stafylokokken	Tetracycline
Streptokokken A,B,C,G	Tetracycline
Pneumokokken	Tetracycline
<i>Burkholderia pseudomallei</i>	Tetracycline

Erasmus MC  **SWAB** Stichting Werkgroep Antibioticabeleid

Staphylococcus spp.
Expert Rules and Intrinsic Resistance Tables

Macrolides, lincosamides and streptogramins	MIC breakpoints (mg/L)			Disk content (µg)	Zone diameter breakpoints (mm)		
	S ≤	R >	ATU		S ≥	R <	ATU
Azithromycin	2 ¹	2 ¹			Note ^A	Note ^A	
Clarithromycin	1 ¹	2 ¹			Note ^A	Note ^A	
Erythromycin	1	2		15	21	18	
Erythromycin (screen only)	1 ¹	1 ¹		15	21 ^A	21 ^A	

Getallen anders!!

- 1/A. Erythromycin can be used to screen for macrolide resistance in staphylococci. Isolates categorised as **screen negative** can be reported **susceptible to azithromycin, clarithromycin and roxithromycin**. Isolates categorised as **screen positive** should be **tested for susceptibility to individual agents or reported resistant**.

Disk diffusie voor anaeroben

- Gedetailleerde info: seminar van de EUCAST van 9 december 2021 (beschikbaar via EUCAST website)
- Project loopt nog
- Nu informatie beschikbaar over 5 species en een beperkt aantal antibiotica
- In de loop van 2022 volgen voor deze species meer antibiotica
- Daarna andere species en andere incubatietijden

Erasmus MC Universitair Medisch Centrum Rotterdam  **SWAB** Stichting Werkgroep Antibioticabeleid 

Momenteel beschikbaar

Species and antimicrobial agents

- 5 commonly isolated anaerobic bacteria
 - *Bacteroides* spp.
 - *Prevotella* spp.
 - *Fusobacterium necrophorum*
 - *Clostridium perfringens*
 - *Cutibacterium acnes*
- Clinically relevant antimicrobial agents
 - Benzylpenicillin 1 unit
 - Piperacillin-tazobactam 30-6 µg
 - Meropenem 10 µg
 - Vancomycin 5 µg
 - Clindamycin 2 µg
 - Metronidazole 5 µg

Dia van EUCAST seminar 9-12-2021

Erasmus MC Universitair Medisch Centrum Rotterdam  **SWAB** Stichting Werkgroep Antibioticabeleid 

De methode in het kort

Disk diffusion methodology

- **Medium:** Fastidious Anaerobe Agar (FAA) with 5% mechanically defibrinated horse blood
 - Agar depth 4.0 ± 0.5 mm
 - Plates must be dried prior to inoculation
- **Inoculum:** McF 1.0 (overnight culture from non-selective media)
- **Incubation:** Anaerobic environment
35-37°C for 16-20 h

Dia van EUCAST seminar 9-12-2021

Erasmus MC  **SWAB** Stichting Werkgroep Antibioticabeleid 

Methode (2)

Streaking of plates and application of disks

- For *Bacteroides* spp., remove excess fluid by turning the swab against the inside of the tube to avoid over-inoculation.
- Spread the inoculum evenly over the entire agar surface, ensuring that there are no gaps between streaks.
 - This is particularly important for *Cutibacterium acnes*, which grows with small colonies and poor contrast to the FAA media.
- Limit the number of disks on each plate to allow good growth and to avoid overlapping of zones.

Voorbeeld uit breekpuntentabel 2022

Anaerobic bacteria EUCAST Clinical Breakpoint Tables v. 12.0, valid from 2022-01-01
For species not listed below, see EUCAST Guidance Document on how to test and interpret results when there are no breakpoints
Expert Rules and Intrinsic Resistance Tables

MIC determination (agar dilution)
Medium: Fastidious Anaerobe Agar (FAA)
Inoculum: 10⁷ CFU/spot
Incubation: Anaerobic environment, 35-37°C, 48h
Reading: Unless otherwise stated, read MICs at the lowest concentration of the agent where a noticeable difference is seen in visible growth between the test and control plate.
Quality control: *Bacteroides fragilis* ATCC 25285 and *Clostridium perfringens* ATCC 13124.
Clostridium perfringens: For control of the inhibitor component of beta-lactam inhibitor combinations, see EUCAST QC Tables.
Clostridium perfringens DSM 25589 with a metronidazole 5 µg disk to monitor the anaerobic atmosphere.

Disk diffusion (EUCAST standardised disk diffusion method)
Medium: Fastidious Anaerobe Agar (FAA). The plates should be dried prior to inoculation (at 20-25°C overnight or at 35°C, with the lid removed, for 15 min).
Inoculum: McFarland 1.0
Incubation: Anaerobic environment, 35-37°C, 18±2h
Reading: Unless otherwise stated, read zone edges as the point showing no growth viewed from the front of the plate with the lid removed and with reflected light. See pictures below and the EUCAST Reading Guide for disk diffusion of anaerobic bacteria for further information.
Quality control: *Bacteroides fragilis* ATCC 25285 and *Clostridium perfringens* ATCC 13124. For control of the inhibitor component of beta-lactam inhibitor combination disks, see EUCAST QC Tables.
Clostridium perfringens DSM 25589 with a metronidazole 5 µg disk to monitor the anaerobic atmosphere.

Bacteroides spp.

Antimicrobial agent	MIC breakpoints (mg/L)			Disk content (µg)	Zone diameter breakpoints (mm)			Notes
	S ≤	R >	ATU		S ≤	R <	ATU	
Piperacillin-tazobactam	8 ¹	8 ¹		38-6	20	20		Notes Numbered notes relate to general comments and/or MIC breakpoints. Lettered notes relate to the disk diffusion method. 1. For susceptibility testing purposes, the concentration of tazobactam is fixed at 4 mg/L. 2A. The meropenem zone diameter breakpoint will detect all cfaA gene mediated carbapenem resistance in <i>Bacteroides fragilis</i> . Some isolates with an MIC of 1 mg/L may harbour the cfaA gene. 3/B. For information on how to use breakpoints in brackets, see https://www.eucast.org/eucastguidancedocuments/ . C. Examine zones carefully for colonies within zones. Colonies should be taken into account when reading.

Oude 2021 schema Pneumokokken

Streptococcus pneumoniae EUCAST Clinical Breakpoint Tables v. 11.0, valid from 2021-01-01
Expert Rules and Intrinsic Resistance Tables

An MIC breakpoint of ≤ 0.061 mg/L is an arbitrary, "off scale" breakpoint (corresponding to a zone diameter breakpoint of " ≥ 38 mm") which categorises wild-type organisms (organisms without phenotypically detectable resistance mechanisms to the agent) as "Susceptible, increased exposure" (I). For these organism-agent combinations, never report "Susceptible, standard dosing regimen" (S).

Screening for beta-lactam resistance in *S. pneumoniae*

Oxacillin 1 µg disk test or benzylpenicillin MIC

See the EUCAST warning on the use of benzylpenicillin gradient tests at <http://www.eucast.org/warnings/>.

Oxacillin zone diameter ≥ 20 mm or benzylpenicillin MIC ≤ 0.06 mg/L
Excludes all beta-lactam resistance mechanisms

Oxacillin zone diameter < 20 mm or benzylpenicillin MIC > 0.06 mg/L
Beta-lactam resistance mechanism detected

Report susceptible (S) to any beta-lactam agents for which clinical breakpoints are available, including those with "Note", except for cefaclor, which if reported, should be reported "susceptible, increased exposure" (I)

Report resistant (R)

Determine the MIC and interpret according to the clinical breakpoints

Report susceptible (S)

Determine the MIC and interpret according to the clinical breakpoints

Report susceptible (S)

Report susceptible (S)

Determine the MIC and interpret according to the clinical breakpoints

For intravenous ampicillin, amoxicillin and piperacillin (without and with inhibitor), infer susceptibility from ampicillin

For oral amoxicillin (without and with inhibitor), see breakpoint recommendations

For cefepime, cefotaxime, ceftazidime, ceftibiprole and ceftioxiime, determine the MIC and interpret according to the clinical breakpoints recommendations

* In meningitis confirm by determining the MIC for the agent considered for clinical use.

Erasmus MC **SWAB** Stichting Werkgroep Antibioticabeleid H+MC

Nieuwe schema pneumokokken

Streptococcus pneumoniae EUCAST Clinical Breakpoint Tables v. 12.0, valid from 2022-01-01
Expert Rules and Intrinsic Resistance Tables

Streptococcus pneumoniae: Flow chart based on the oxacillin screen test for beta-lactam resistance mechanisms to reduce the number of specific tests for beta-lactam agents

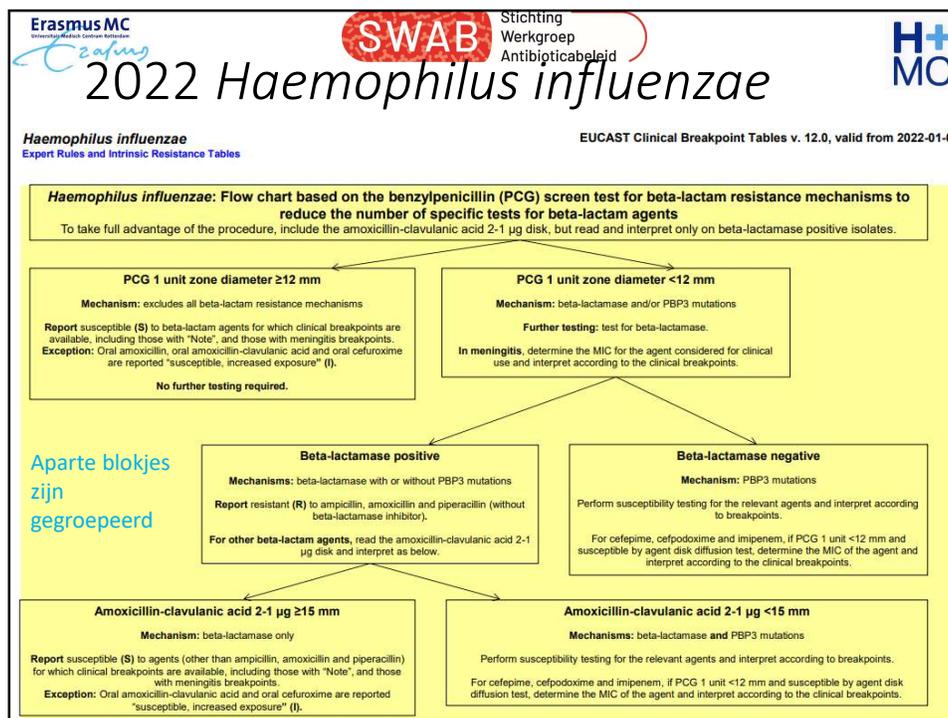

See the EUCAST warning on the use of benzylpenicillin gradient tests at <http://www.eucast.org/warnings/>.

Oxacillin 1 µg zone diameter ≥ 20 mm (or benzylpenicillin MIC ≤ 0.06 mg/L)
Mechanism: excludes all beta-lactam resistance mechanisms
Report susceptible (S) to beta-lactam agents for which clinical breakpoints are available, including those with "Note", and those with meningitis breakpoints. Exception: Cefaclor is reported "susceptible, increased exposure" (I).
No further testing required.

Oxacillin 1 µg zone diameter < 20 mm (or benzylpenicillin MIC > 0.06 mg/L)
Mechanism: beta-lactam resistance detected
Report: resistant (R) to benzylpenicillin (meningitis) and phenoxymethylpenicillin (all indications).
For benzylpenicillin (indications other than meningitis), perform and interpret MIC according to breakpoints.
For other beta-lactam agents, see below.

Oxacillin 1 µg zone diameter 9-19 mm
Report susceptible (S) without further testing to: ampicillin, amoxicillin and piperacillin (without and with beta-lactamase inhibitor), cefepime, cefotaxime, ceftazidime, ceftibiprole, ceftioxiime, imipenem and meropenem.
For other beta-lactam agents, perform susceptibility testing for the relevant agent and interpret according to breakpoints.
This guidance is also valid for meningitis breakpoints.

Oxacillin 1 µg zone diameter < 9 mm
Perform susceptibility testing for the relevant agent and interpret according to breakpoints.
This guidance is also valid for meningitis breakpoints.
